

Infant Brain Imaging Study

University of Washington and
Seattle Children's
Research Study

Do you have a child diagnosed with autism spectrum disorder who has a younger infant sibling?

The University of Washington Autism Center and Seattle Children's is conducting a study to identify infants who may be at risk for autism. Free developmental evaluations and brain imaging studies will be provided when infants are 6, 12, and 24 months of age to help parents obtain early intervention for infants who are showing early signs of autism. To participate, your infant must be 6 months old or younger and have a sibling with an autism spectrum disorder. To learn more about the study, call: **1- 800- 994- 9701.**
